

ecowec wasteHEAT

Ecowec wasteHEAT is an energy-efficient total solution for property heating

The system combines traditional district heating with the Ecowec wastewater heat recovery system, which significantly increases energy efficiency. Within the system, the heat contained in the wastewater is recycled back into property and domestic water heating, which significantly reduces the need for district heating.

Ecowec wasteHEAT system delivery content

The system's devices are selected and sized according to the property's heating needs.

The system is delivered as a single equipment package with connection instructions, which the plumbing contractor installs on-site. The equipment delivery includes commissioning support and warranty-time remote monitoring.

Ecowec wasteHEAT reliable operation and savings

By purchasing the system as a whole, the energy-efficient and reliable interaction of the devices is ensured in different seasons and usage scenarios. The system also saves on maintenance costs during its operation by integrating all devices into the property's building automation and the maintenance company's monitoring. The system's yield and savings can be verified through the system and building automation.
